

Digital Controller Module SD7

- For position, pressure and volume flow controls
- Interface:
 - analogue
 - CANopen / J1939
 - Profibus DP
 - HART
- Analogue or SSI sensors for the feedback signal
- Integrated final power stage
- Adjustment via PC
- For snapping on to dome rail
- Also available as amplifier module (see data sheet 1.13-101)

DESCRIPTION

Digital controller module for installation on dome rail for driving proportional or switching valves with one or two solenoids. Regulation of pressure, volume flow or position can be realized. The parameterisation takes place by means of menu-controlled parameterisation- and diagnostics software «PASO» from Wandfluh (USB-interface). The electronics are optionally available with different field bus interfaces.

FUNCTION

The controller module has two Pulse-Width-Modulated current outputs with superimposed dither signal. The analog and digital inputs as well as the digital outputs are individually programmable. With the Enhanced controller, the command value (position, pressure, force, etc.) can also be specified by means of freely adjustable travel profiles. The fieldbus connection enables reading the command value signal respectively the feedback value signal as well as the parameterisation directly via the fieldbus.

APPLICATION

As snap-on module, the controller module is mainly utilised in the industrial field. The module can be mounted on dome rails. Thanks to numerous digital inputs and outputs, the controller module can be connected to a higher-level machine control. Alternatively, the Enhanced controller can be used to control valves with integrated controllers (e.g. DSV, servo valves, etc.) via the analog output.

GENERAL SPECIFICATIONS

Execution	Module for control cubicle, housing made of plastic
Installation	on 35 mm dome rail according to EN 60715
Weight	
• Basic controller analog	130 g
• Basic controller fieldbus	220 g
• Enhanced controller analog	220 g
• Enhanced controller fieldbus	240 g
Connections	Screw terminals, max. cable cross-section 2,5 mm ²
Working temperature	-20...+70 °C

Further information can be found in the Operating instructions.

COMMISSIONING

Information regarding installation and commissioning are contained in the information leaflet supplied with the controller module and in the operating instructions. Further information can be found on our website: www.wandfluh.com

- Free-of-charge download:
- «PASO» Parameterisation software
 - Operating instructions (.pdf)
 - Device description data: (EDS file «WAGSD7C1.ed») (GSD file «SD7-0B8E.gsd»)

ADDITIONAL INFORMATION

Wandfluh electronics general	Wandfluh documentation
Proportional spool valves	Register 1.13
Proportional pressure valves	Register 1.10
Proportional flow valves	Register 2.3
	Register 2.6

TYPE CODE

	S	D7	3		2			-		#	
Control cubicle											
Digital											
Adjustable with PASO											
Software configuration (function of card):											
• Basic controller											
• Enhanced controller											
2-solenoid version											
Supply voltage:

ELECTRICAL SPECIFICATIONS

Protection class	IP 30 according to EN 60 529	Fieldbus (option)	
Supply voltage	24 VDC or 12 VDC	• Device receptacle	DSUB, 9-pole, CANopen, J1939, Profibus
Voltage range:		• Screw terminals	HART
• 24 VDC	21...30 V	• Bus topology	Line, differential signal transmission
• 12 VDC	10,5...15 V	• Potential separation	500 VDC
Residual ripple	<10 %		
Fuse	Low	Solenoid current:	
Current consumption:		• Minimal current I_{min}	Adjustable 0...950 mA Factory setting 150 mA
• No-load current	approx. 40 mA	• Maximal current I_{max}	Adjustable $I_{min}...1,8 A$ (with 24 VDC) $I_{min}...2,3 A$ (with 12 VDC) Factory setting 700 mA
• Maximum current consumption	No-load current + 1,8 A per solenoid (with 24 VDC) Consumption no-load current + 2,3 A per solenoid (with 12 VDC)	• Accumulated current limitation	The accumulated current of the simultaneously controlled solenoids depends on the ambient temperature. Further information can be found in the Operating instructions. Frequency adjustable 2...500 Hz Factory setting 100 Hz Level adjustable 0...400 mA Factory setting 100 mA
Command value signal:	Selectable by means of software Input 1 and 2 and 4 (option): Differential input not galvanically separated, for ground potential difference up to 1,5 V 4...+20 mA/0...+20 mA 0...+10 V (1- or 2-solenoid version) -10...+10 V (2-solenoid version only) Input 3 (option): Galvanically separated for HART signal	Dither	Temperature drift Digital inputs
Resolution	10-bit (for analog inputs 1 and 2) 16-bit (for analog inputs 3 and 4)		Switching threshold high 6...30 VDC Switching threshold low 0...1 VDC Digital input 5 – 7 can be used as frequency input (frequencies 0...5 kHz) and as PWM input (automatic frequency recognition)
Input resistance	Voltage input >18 k Ω Load for current input = 250 Ω	Digital outputs	Low-Side-Switch: $U_{max} = 40$ VDC $I_{max} = -700$ mA 0...500 s
Measuring system input	DSUB plug coupling 9-pole (female) to front panel according to RS422 standard selectable by software - Absolutely via Start/Stop - Absolutely via SSI (1... 32 bit, gray or binary)	Ramps adjustable	Serial interface
Analog output	Enhanced controller: Voltage output ± 10 VDC Max. output current ± 3 mA Enhanced controller with HART: Current output 0...20 mA Max. output voltage 12 VDC	Serial interface	USB (plug type B) for parameterising with «PASO»
Stabilised output voltage	10 VDC (with 24 VDC) 8 VDC (with 12 VDC) Max. load 30 mA	EMV Immunity Emission	EN 61 000-6-2 EN 61 000-6-4

- 24 = Analog input 4 -

FUNCTION DESCRIPTION

The controller module can be parameterised by means of the parameterisation software «PASO» through the USB-interface. In addition, the parameterisation software makes a data analysis possible.

CONTROLLER MODULE SD7
Command value scaling

The command value can be applied via the fieldbus or as a voltage, current, digital, frequency or PWM signal. The input used can be selected for each command value. The scaling is carried out via the «Interface» and «Reference» parameters. Furthermore, each command value can be monitored for cable break (except HART, voltage and digital signal). For every command value, a dead band can also be set. Optionally one can operate with two command values. The characteristic of these command values can be adjusted.

Profiles/Fixed command values (Enhanced controller only)

There are 7 fixed command values available, which can be selected via 3 digital inputs. Optionally, travel profiles can also be used. The SD7 controller module is able to store and to travel whole travel profiles, which have been previously generated by the user in the profile generator. A travel profile consists of the following data:

- Target position (target or end position of the sequence)
- Speed (of the travel)
- Acceleration (to reach the speed)
- Deceleration (starting from the speed)
- Stop time (after reaching the end position of the sequence)
- Setting of a digital output when reaching the end position of the sequence
- Adjust whether the command value or the feedback value for the end of the sequence is to be queried

Command value generator

In the open-loop controller modes, there are two linear ramps for up and down per solenoid output available, which can be adjusted separately. In the closed-loop controller modes, there is a positive and a negative travel speed available.

HOLD command value (option Fieldbus only)

If via fieldbus the device is put into the «HOLD» state, the respective command value is activated.

Feedback value scaling

The feedback value can be applied via HART or as voltage, current, frequency or PWM signal. For the feedback value, the input used can be selected. The scaling is carried out via the «Interface» and «Reference» parameters. In addition, the feedback value can be monitored for cable break (except HART and voltage signal).

Manual operation (Enhanced controller only)

The commands Enable, Forward, Reverse and Fast speed are available. This makes it possible to move the cylinders through a superimposed control without specifying a command value.

Window

A target, tracking error and solenoid stop window is available. The threshold and delay time can be set for each window.

Controller

The SD7 controller module has a controller circuit. This is built up as PID controller. The following controller modes can be selected:

Controller mode «Pressure/flow valve control»

Control of a pressure relief, pressure reducing, throttle or flow control valve in open control circuit (without feedback value signal). The number of solenoids controlled depends on the selected operating mode of operation.

Controller mode «Pressure/flow valve control (1-sol)»

Control of a 1-solenoid pressure relief, pressure reducing, throttle or flow control valve in closed control circuit (with feedback value signal). Only one solenoid can be controlled with it (corresponds to the solenoid driver 1).

Controller mode «Pressure control (2-sol)»

Control of two 1 solenoid throttle valves in closed control circuit (with feedback value signal) as pressure control. The one throttle valve serves as a loading valve and the other as an unloading valve. The loading valve corresponds to the solenoid driver 1, the unloading valve corresponds to the solenoid driver 2.

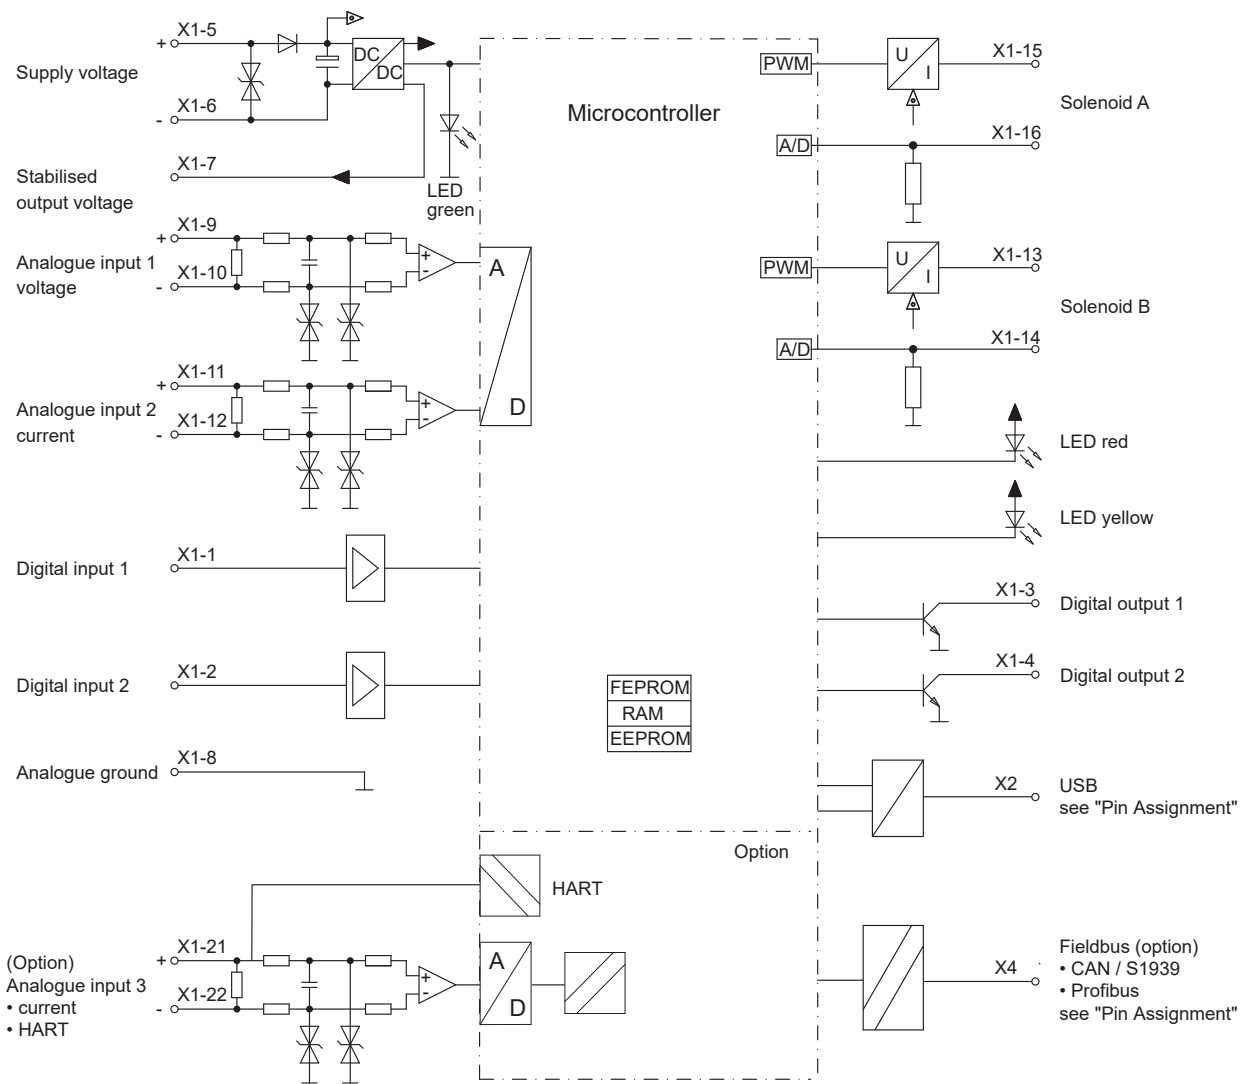

Controller mode «Axis position controlled»

Control of a spool valve in open control circuit (without feedback value signal). The number of solenoids controlled depends on the selected mode of operation.

Controller mode «Axis position controlled (2-sol)»

Control of a 2-solenoid spool valve in closed control circuit (with feedback value signal). Two solenoids can be controlled with it.
